Abstract

What is caffeine? This is a basic question which most probably everyone knows upto a certain extent.

Caffeine is a CNS stimulant. It is also known as a “double edged sword”. We all consume coffee, soda, energy drinks like redbull which contains caffeine in considerable quantities. Caffeine is highly useful in small amounts, they are also used in the medicines too.

Moderate amount is considered as safe. Now being a dentist I want to focus particularly in the impact of the caffeine to the oral cavity. Knowing this it will help the readers to restrict how much caffeine we can consume each day.

Now I will highlight the impacts in the tooth

1)Tooth Staining:

Usually the high amount of intakes in caffeine can leave stains behind your teeth. This was not reported by me, instead it is as from Donna J. Phinney and Judy H. Halstead who are the authors of “Delmars dental assisting: A comprehensive approach.” Larger amounts of coffee, tea, soda they certainly cause the teeth yellowish in colour or slightly brownish stains between the tooth as well as in the surface. The amount of reduction in the consumption can help further staining and the damage of the teeth. It is recommended that people use the straw to consume the liquids which are high in caffeine.

2)Dental caries

As the enamel wears off our teeth are vulnerable because of the damage. Large amounts of caffeine results in the degradation and the decaying of the enamel in the teeth. It will increase the enamel in thinning and allowing the under layer to appear, which results in the discolouration of tooth and tooth sensitivity. The lesser the amount of the caffeine consumed, more the teeth remain healthy. Drinking through the straw is the basic solution.

3) Teeth clenching:

Heavy intakes of caffeine are also associated with stress. Consuming before the bed time is not advised. Teeth clenching can lead to the jaw pain as well as the teeth pain.

Other side effects:

1)Insomnia

2)Polyuria

Conclusion: The topic may appear as silly, but it has a certain long term implications. Although the caffeine provides the refreshment, it is certainly bad for the teeth and the oral cavity. This article is certainly meant to create the awareness which is indirectly related to our daily consumption in our day to day life. The depressing in the amount of caffeine consumption will definitely prevent the dental caries and diseases like teeth sensitivity. It is the duty of the certain dentists and the hygienists to educate and create the awareness in the society. Especially it will do a lot of good for children as well, where they may be the chances of amelogenesis and the destruction of the enamel in the developmental stage itself.
